Hypothesis Testing Solved Examples(Questions and Solutions ...

Solution: Sample size $n = 50$ Sample mean = 10 km Sample standard deviation $s = 3.5$ km . Population mean $\mu = 9.5$ km. Since population SD is unknown we consider $\sigma = s$. The sample is a large sample and so we apply Z-test. Null Hypothesis: There is no significant difference between the sample average and the company's claim, i.e., $H_0: \mu = 9.5$

Chapter 7: Hypothesis Testing - Solutions 7.1 Introduction to Hypothesis Testing The problem with applying the techniques learned in Chapter 5 is that typically, the population mean (μ) and standard deviation (σ) are not known. In chapter 7, we will be looking at the situation when a simple random sample is taken from a large population with ...

Chapter 7: Hypothesis Testing - Solutions

The main objective in statistics is testing a hypothesis. For example, you could conduct a test to find either a drug is effective or not for treating headaches. If you repeat the experiment then no one would take the results seriously. A hypothesis is an educated guess that analyze the things around you and it [...]

Hypothesis testing is a statistical method that is used in making statistical decisions using experimental data. Hypothesis Testing is basically an assumption that we make about the population parameter.

Hypothesis Testing - Statistics Solutions

Hypothesis testing is a statistical process to determine the likelihood that a given or null hypothesis is true. It goes through a number of steps to find out what may lead to rejection of the hypothesis when it's true and acceptance when it's not true. This article discusses the steps which a given hypothesis goes through, including the decisional errors that could happen in a statistical ...

If the biologist set her significance level (α) at 0.05 and used the critical value approach to conduct her hypothesis test, she would reject the null hypothesis if her test statistic t^* were less than -1.6939 (determined using statistical software or a t-table):s-3-3. Since the biologist's test statistic, $t^* = -4.60$, is less than -1.6939, the biologist rejects the null hypothesis.

The statement of our problem will determine which kind of test to use. If the alternative hypothesis contains a "not equals to" sign, then we have a two-tailed test. In the other two cases, when the alternative hypothesis contains a strict inequality, we use a one-tailed test. This is our situation, so

we use a one-tailed test.

The solution to the problem follows the poem. Notice that the hypothesis test is for a single population proportion. This means that the null and alternate hypotheses use the parameter (p) .

Hypothesis Tests: Single-Sample t Tests
Hypothesis test in which we compare data from one sample to a population for which we know the mean but not the standard deviation.
Degrees of Freedom: The number of scores that are free to vary when estimating a population parameter from a sample $df = N - 1$ (for a Single-Sample t Test)

23.1 How Hypothesis Tests Are Reported in the News
1. Determine the null hypothesis and the alternative hypothesis. 2. Collect and summarize the data into a test statistic. 3. Use the test statistic to determine the p-value. 4. The result is statistically significant if the p-value is less than or equal to the level of significance.
