Ibbotson Equity Risk Premium 2019

The Ibbotson-Chen model is a macroeconomic model for the Equity Risk Premium (ERP). Macroeconomic models are based on the relationship between macroeconomic variables and financial variables. It is important to note that macroeconomic equity risk premium models are only appropriate for developed countries.

Ibbotson-Chen model - Breaking Down Finance

Ibbotson and Harrington demonstrate why using a non-beta-adjusted size premium within the context of the capital asset pricing model (CAPM) to estimate cost of equity capital will likely “double count” beta risk, and therefore overstate risk and understate value. The authors also demonstrate that a non-beta-adjusted size premium used in conjunction with “build-up” methods that employ an industry risk premium would be equally inappropriate.

Using a Non-Beta-Adjusted Size Premium in the Context of ...

The long-term equity risk premium (relative to the long-term government bond yield) is estimated to be about 6% arithmetically, and 4% geometrically. Our estimate is in line with both the historical supply measures of the public

Stock Market Returns in the Long Run: Participating in the ...

Ibbotson and Sinquefeld not only measured the average return on each asset class, and on the risk premiums – they also documented all of the monthly and annual returns. Doing so made it possible to measure the variability of returns, that is, the amount of risk for which investors were being rewarded, not just the size of the reward.
