The marine engines are heat engines used for converting heat, which is generated by burning fuel, into useful work, i.e. developing thermal energy and transforming it into mechanical energy. The engines used onboard ships are internal combustion engines (a type), in which, the combustion of fuel takes place inside the engine cylinder and the heat is generated post the combustion process.

How Ship's Engine Works? - Marine Insight

The field of diesel marine engines is quite vast and the engine itself is made up of several components. These components have been discussed individually in different articles at this website and we have articles on theoretical cycles upon which these engines are designed and operate, and various components such as the crankshaft, bedplate , pistons , liner & head .

Video No. 29 - Fuel Pump Overhaul - Marine Engines & Systems

Intake. During the intake stroke, the piston moves downward, drawing a fresh charge of vaporized fuel/air mixture. The illustrated engine features a poppet intake valve which is drawn open by the vacuum produced by the intake stroke. Some early engines worked this way; however, most modern engines incorporate an extra cam/lifter arrangement as seen on the exhaust valve.
