The Genitalia of the Group Tortricidæ of the Lepidoptera ...

Pierce and Metcalfe divided the Tortricidae into 9 groups on characteristics of the female genitalia, almost entirely on the form of the signum/signa. These groups are mostly but not entirely coincident with the subfamilies and tribes considered here. Most tortrices (tortricids, tortrixes) do not have widely accepted English names.

Male genitalia of Choristoneura species from the Nearctic Region and Palaeartic Region are described and illustrated. The study revealed that the male genitalia are among the most important body parts that contain valuable morphological characters for species distinction or grouping in this genus. They are potentially useful in the clarification of the taxonomic status of species in closely related species groups, such as the spruce budworm species complex in North America.
